Reflection

I used Figma for the first time and was very excited to use it. Figma is an user-friendly design tool for beginners, and its user interface and user experience are compact. I did not use any tutorials to start the Figma as its interface is user-friendly.

Some basic tools like zoom in/out, hand cursor, etc. are very convenient to use. Also, the design tools in the right sidebar are available dynamically according to the selected element. I enjoyed typography and image tools very much. Unlike traditional tools like Photoshop, Figma does not have messed up tools on a single screen. Tools in Figma automatically appear according to their usability.

I found Figma an integral part of a designer's life where they can put their design imaginations on the canvas easily with the help of a plethora of tools.

Every organization needs tools that facilitate collaboration. Figma has this feature, making it easy to collaborate with office colleagues or team members. It is an essential tool for working in a team.

Autosave is one more feature that I like the most about Figma. I need not to click the save button or press Ctrl+S every time to save the design. My design kept saving after every action without notifying me.

This assignment was a basic assignment that helped my a lot to learn Figma basic tools. I lernt how to use backgroud image, color schemes, font-families, text shadows, etc.

It is my understanding that Figma will be a prominent tool in my career as far as UI/UX is concerned. I will keep using Figma for designing purposes and will explore it in complex design. There must be an official tutorial for Figma and on other platforms. I will use them to learn Figma deeply and to enhance my design skills.
